

Mr M S Crilly
BSc MSc DIC
Associate Director

Areas of expertise

Shallow foundations, pile foundations, subsidence and damage, tunnelling impact assessments, site investigations, laboratory testing, field studies.

Experience with GCG

Since joining GCG in 2000 Mike Crilly has worked with a wide range of clients, advising them on a variety of geotechnical issues at tender stage through to project completion.

He has acted as geotechnical advisor to structural consultants and contractors on a large number of projects involving deep foundations and basements. In particular, he has worked on the design and assessment of substructures for various buildings with raft and piled raft foundations, such as 20 Fenchurch St and 5-6 St James's Square. He has acted as Category III checker for the design of the large diameter base-grouted piles and piled rafts for developments at Canary Wharf. He has also been involved with a number of developments involving deep basements.

He has worked on a large number of projects assessing the impact of construction work on tunnels. These schemes have included the construction of excavations and foundations in close proximity to existing infrastructure, such as the assessment of the impact of developments at Heathrow Airport on LUL tunnels and at 351 Caledonian Road on the large diameter HS1 tunnels which run at shallow depth underneath. In addition, he has assess the impact of new developments on both existing Crossrail tunnels, such as at 21 Moorfields, and on proposed Crossrail Line 2 tunnels, such as at Maria Fidelis School.

While working for GCG, Mr Crilly was part of the earthworks design team for Heathrow Terminal 5, looking at ground movements associated with the bulk earthworks being carried out to form many of the tunnels and services on the site, and the implications of these movements for overlying structures and taxiways.

Mr Crilly has been involved in a number of projects involving shallow foundations, advising structural consultants on foundations and ground conditions for refurbishment works and acting as an expert in cases of subsidence damage to buildings.

Mr Crilly has published widely on the subject of foundations for low-rise buildings and is author of three BRE Digests and contributor to several others. He has served on a Géotechnique symposium-in-print committee, the Geotechnical Engineering Advisory Panel and the British Geotechnical Association Executive Committee. He has been invited to present lectures at a wide range of seminars, conferences and courses..

Areas worked

UK, France, Turkey, Kenya, Ireland

GEOTECHNICAL CONSULTING GROUP

52A Cromwell Road London SW7 5BE United Kingdom

Previous experience

On graduation in 1983, Mr Crilly joined Ove Arup and Partners. He was involved in a range of geotechnical work, including desk study appraisal of sites and the selection of suitable site investigation techniques, together with subsequent reporting and foundation design for a number of building projects. He was closely involved in the design of the foundations and deep waterproof basement for the St Enoch Centre, Glasgow, and was assistant Resident Engineer for the piling works. This period also included a one-year secondment to Mowlem, acting as section engineer for the construction of the A1 Portobello Bypass.

In 1986 he attended the MSc course in Soil Mechanics at Imperial College, later becoming a Research Assistant and conducting research into the effects of vegetation on the shrinking and swelling of clay soils. The research involved both field and laboratory work, and was sponsored by SERC, BRE and TRRL. As part of the research, he developed a simple field suction measurement probe, which he installed and tested on three road sites in Kenya. He also undertook commercial laboratory testing, supervised undergraduate laboratories and assisted academic staff with expert witness work.

After a brief period with Pell Frischmann Consulting Engineers Ltd, Mr Crilly joined the Building Research Establishment (BRE). At BRE, he was responsible for the majority of BRE's research programmes on low-rise building foundations including studies of the performance of, and problems associated with, foundations on shrinkable-expansive clays and on soft ground. He was also responsible for the organisation, supervision and direction of experimental work at the Chattenden shrinkable clay test site, establishing the BRE subsidence database and experimental work at the Bothkennar soft clay test site. At BRE, he has undertaken several consultancy commissions, many of which involved investigations into building damage to help settle disputes between insurers. Other commissions included:

- drafting of an engineering guide to the National House-Building Council's Standards on building near trees
- acting as advisor to the National Galleries of Scotland following deterioration of timber piles beneath the Royal Scottish Academy building
- design and delivery of a series of CPD courses for loss adjusters and the International Society of Arboriculture
- drafting of a national 10-year strategy for geotechnical research.

Education/Research

PhD research, Imperial College, London, 1987 - 1990

MSc (Distinction), Imperial College, London, 1987

BSc, University of Glasgow, 1983

Service on Technical/Professional Bodies

Executive committee member of British Geotechnical Association, 2006-2009.

Member of *Geotechnical Engineering* Advisory Panel, 2003 – 2006.

Member of *Géotechnique* symposium-in-print committee 2001-2003.

Member of British Standards Institution Committee B/213/2 - Trees in relation to construction, 1995 – 2000.

UK representative on the International Society of Soil Mechanics and Geotechnical Engineering's Technical Committee on Expansive Soils (TC6), 1992 – 1997.
